

New Resource Available: VETting Green Coaches guide

We are pleased to announce that the VETting Green Coaches Guide has officially been published and is now accessible through the project website. This new resource was developed specifically to assist tutors, trainers, and coaches in mentoring students as they navigate the VETting Green online course. By providing a detailed breakdown of the course structure alongside practical delivery recommendations, the guide ensures that educators can effectively enhance the overall learning experience for every participant.

The aim of the manual focuses on the essential principles of online coaching, offering trainers valuable insights into managing a digital learning environment. The material is designed to help mentors foster a supportive and interactive atmosphere where learners feel empowered to participate actively and deepen their professional knowledge.

Furthermore, the guide offers a clear explanation of how the training modules are organised on the platform, allowing trainers to understand the progression of learning topics and how participants move through the content. It also includes functional advice on monitoring student progress, assessing engagement levels, and maximising the utility of the rest of the tool integrated into the project.

A significant part of the guide is dedicated to methods intended to promote collaboration among participants as they explore complex subjects such as sustainability, ethical industry practices, and the challenges of greenwashing within the fashion and footwear sectors.

This Coaches Guide is currently available for download on the project website, and we invite all trainers and professionals dedicated to sustainability in the fashion industry to utilise this resource in their upcoming training activities.

The publication of this guide represents a significant milestone as VETting Green enters its final phase. As an Erasmus+ initiative, the project has worked to bridge the gap between environmental theory and industrial reality, and this is part of the materials to ensure the project's long-term impact.
